Safety Notes

General Power Tool Safety Warnings

⚠WARNING **Read all safety warnings and all instructions.** Failure to follow the warnings and instructions may result in electric shock, fire and/or serious injury.

Save all warnings and instructions for future reference.

The term “power tool” in the warnings refers to your mains-operated (corded) power tool or battery-operated (cordless) power tool.

1) Work area safety

a) Keep work area clean and well lit. Cluttered or dark areas invite accidents.

b) Do not operate power tools in explosive atmospheres, such as in the presence of flammable liquids, gases or dust. Power tools create sparks which may ignite the dust or fumes.

c) Keep children and bystanders away while operating a power tool. Distractions can cause you to lose control.

2) Electrical safety

a) Power tool plugs must match the outlet. Never modify the plug in any way. Do not use any adapter plugs with earthed (grounded) power tools. Unmodified plugs and matching outlets will reduce risk of electric shock.

b) Avoid body contact with earthed or grounded surfaces, such as pipes, radiators, ranges and refrigerators. There is an increased risk of electric shock if your body is earthed or grounded.

c) Do not expose power tools to rain or wet conditions. Water entering a power tool will increase the risk of electric shock.

d) Do not abuse the cord. Never use the cord for carrying, pulling or unplugging the power tool. Keep cord away from heat, oil, sharp edges and moving parts. Damaged or entangled cords increase the risk of electric shock.

e) When operating a power tool outdoors, use an extension cord suitable for outdoor use. Use of a cord suitable for outdoor use reduces the risk of electric shock.

f) If operating a power tool in a damp location is unavoidable, use a residual current device (RCD) protected supply. Use of an RCD reduces the risk of electric shock.

3) Personal safety

a) Stay alert, watch what you are doing and use common sense when operating a power tool. Do not use a power tool while you are tired or under the influence of drugs, alcohol or medication. A moment of inattention while operating power tools may result in serious personal injury.

b) Use personal protective equipment. Always wear eye protection. Protective equipment such as dust mask, non-skid safety shoes, hard hat, or hearing protection used for appropriate conditions will reduce personal injuries.

c) Prevent unintentional starting. Ensure the switch is in the off-position before connecting to power source and/or battery pack, picking up or carrying the tool. Carrying power tools with your finger on the switch or energising power tools that have the switch on invites accidents.

d) Remove any adjusting key or wrench before turning the power tool on. A wrench or a key left attached to a rotating part of the power tool may result in personal injury.

e) Do not overreach. Keep proper footing and balance at all times. This enables better control of the power tool in unexpected situations.

f) Dress properly. Do not wear loose clothing or jewellery. Keep your hair, clothing and gloves away from moving parts. Loose clothes, jewellery or long hair can be caught in moving parts.

g) If devices are provided for the connection of dust extraction and collection facilities, ensure these are connected and properly used. Use of dust collection can reduce dust-related hazards.

4) Power tool use and care

a) Do not force the power tool. Use the correct power tool for your application. The correct power tool will do the job better and safer at the rate for which it was designed.

b) Do not use the power tool if the switch does not turn it on and off. Any power tool that cannot be controlled with the switch is dangerous and must be repaired.

c) Disconnect the plug from the power source and/or the battery pack from the power tool before making any adjustments, changing accessories, or storing power tools. Such preventive safety measures reduce the risk of starting the power tool accidentally.

d) Store idle power tools out of the reach of children and do not allow persons unfamiliar with the power tool or these instructions to operate the power tool. Power tools are dangerous in the hands of untrained users.

e) Maintain power tools. Check for misalignment or binding of moving parts, breakage of parts and any other condition that may affect the power tool's operation. If damaged, have the power tool repaired before use. Many accidents are caused by poorly maintained power tools.

f) Keep cutting tools sharp and clean. Properly maintained cutting tools with sharp cutting edges are less likely to bind and are easier to control.

g) Use the power tool, accessories and tool bits etc. in accordance with these instructions, taking into account the working conditions and the work to be performed. Use of the power tool for operations different from those intended could result in a hazardous situation.

5) Service

a) Have your power tool serviced by a qualified repair person using only identical replacement parts. This will ensure that the safety of the power tool is maintained.

Safety Warnings for Circular Saws

- **DANGER: Keep hands away from cutting area and the blade. Keep your second hand on auxiliary handle, or motor housing.** If both hands are holding the saw, they cannot be cut by the blade.
- **Do not reach underneath the workpiece.** The guard cannot protect you from the blade below the workpiece.
- **Adjust the cutting depth to the thickness of the workpiece.** Less than a full tooth of the blade teeth should be visible below the workpiece.
- **Never hold the workpiece being cut in your hands or across your leg. Secure the workpiece to a stable platform.** It is important to support the work properly to minimize body exposure, blade binding, or loss of control.
- **Hold the power tool only by the insulated gripping surfaces when performing an operation where the cutting tool may contact hidden wiring or its own cord.** Contact with a "live" wire will also make exposed metal parts of the power tool "live" and shock the operator.
- **When ripping always use a rip fence or straight edge guide.** This improves the accuracy of cut and reduces the chance of blade binding.
- **Always use blades with correct size and shape (diamond versus round) of arbour holes.** Blades that do not match the mounting hardware of the saw will run eccentrically, causing loss of control.
- **Never use damaged or incorrect blade washers or bolt.** The blade washers and bolt were specially designed for your saw, for optimum performance and safety of operation.

- **Causes and operator prevention of kickback:**
  – Kickback is a sudden reaction to a pinched, bound or misaligned saw blade, causing an uncontrolled saw to lift up and out of the workpiece toward the operator.
  – When the blade is pinched or bound tightly by the kerf closing down, the blade stalls and the motor reaction drives the unit rapidly back toward the operator.
  – If the blade becomes twisted or misaligned in the cut, the teeth at the back edge of the blade can dig into the top surface of the wood causing the blade to climb out of the kerf and jump back toward the operator.
  Kickback is the result of saw misuse and/or incorrect operating procedures or conditions and can be avoided by taking proper precautions as given below.
- **Maintain a firm grip with both hands on the saw and position your arms to resist kickback forces. Position your body to either side of the blade, but not in line with the blade.** Kickback could cause the saw to jump backwards, but kickback forces can be controlled by the operator, if proper precautions are taken.
- **When blade is binding, or when interrupting a cut for any reason, release the trigger and hold the saw motionless in the material until the blade comes to a complete stop. Never attempt to remove the saw from the work or pull the saw backward while the blade is in motion or kickback may occur.** Investigate and take corrective actions to eliminate the cause of blade binding.
- **When restarting a saw in the workpiece, centre the saw blade in the kerf and check that saw teeth are not engaged into the material.** If saw blade is binding, it may walk up or kickback from the workpiece as the saw is restarted.
- **Support large panels to minimise the risk of blade pinching and kickback.** Large panels tend to sag under their own weight. Supports must be placed under the panel on both sides, near the line of cut and near the edge of the panel.
- **Do not use dull or damaged blades.** Unsharpened or improperly set blades produce narrow kerf causing excessive friction, blade binding and kickback.
- **Blade depth and bevel adjusting locking levers must be tight and secure before making cut.** If blade adjustment shifts while cutting, it may cause binding and kickback.
- **Use extra caution when making a “plunge cut” into existing walls or other blind areas.** The protruding blade may cut objects that can cause kickback.
- **Check lower guard for proper closing before each use. Do not operate the saw if lower guard does not move freely and close instantly. Never clamp or tie the lower guard into the open position.** If saw is accidentally dropped, lower guard may be bent. Raise the lower guard with the retracting handle and make sure it moves freely and does not touch the blade or any other part, in all angles and depths of cut.
- **Check the operation of the lower guard spring. If the guard and the spring are not operating properly, they must be serviced before use.** Lower guard may operate sluggishly due to damaged parts, gummy deposits, or a build-up of debris.
- **Lower guard should be retracted manually only for special cuts such as “plunge cuts” and “compound cuts”. Raise lower guard by retracting handle and as soon as blade enters the material, the lower guard must be released.** For all other sawing, the lower guard should operate automatically.
- **Always observe that the lower guard is covering the blade before placing saw down on bench or floor.** An unprotected, coasting blade will cause the saw to walk backwards, cutting whatever is in its path. Be aware of the time it takes for the blade to stop after switch is released.
- **Do not reach into the saw dust ejector with your hands.** They could be injured by rotating parts.
- **Do not work overhead with the saw.** In this manner you do not have sufficient control over the power tool.

- **Use suitable detectors to determine if utility lines are hidden in the work area or call the local utility company for assistance.** Contact with electric lines can lead to fire and electric shock. Damaging a gas line can lead to explosion. Penetrating a water line causes property damage or may cause an electric shock.
- **Do not operate the power tool stationary.** It is not designed for operation with a saw table.
- **Do not use high speed steel (HSS) saw blades.** Such saw blades can easily break.
- **Do not saw ferrous metals.** Red hot chips can ignite the dust extraction.
- **When working with the machine, always hold it firmly with both hands and provide for a secure stance.** The power tool is guided more secure with both hands.
- **Secure the workpiece.** A workpiece clamped with clamping devices or in a vice is held more secure than by hand.
- **Always wait until the machine has come to a complete stop before placing it down.** The tool insert can jam and lead to loss of control over the power tool.
- **Never use the machine with a damaged cable. Do not touch the damaged cable and pull the mains plug when the cable is damaged while working.** Damaged cables increase the risk of an electric shock.

Functional Description

Read all safety warnings and all instructions. Failure to follow the warnings and instructions may result in electric shock, fire and/or serious injury.

While reading the operating instructions, unfold the graphics page for the machine and leave it open.

Intended Use

The machine is intended for lengthways and crossways cutting of wood with straight cutting lines as well as mitre cuts in wood while resting firmly on the workpiece. With suitable saw blades, thin-walled non-ferrous metals, e. g., profiles, can also be sawed.
Working ferrous metals is not permitted.

Product Features

The numbering of the product features refers to the illustration of the machine on the graphics page.

1 On/Off switch
2 Safety switch for On/Off switching
3 Auxiliary handle
4 Spindle lock button
5 Scale for mitre angle
6 Wing bolt for bevel-angle preselection
7 Wing bolt for parallel guide
8 Cutting mark, 45°
9 Cutting mark, 0°
10 Parallel guide
11 Retracting blade guard
12 Base plate
13 Lever for retracting blade guard
14 Sawdust ejector
15 Blade guard
16 Allen key
17 Clamping bolt with washer
18 Clamping flange
19 Saw blade*
20 Mounting flange
21 Saw spindle
22 Extraction adapter*
23 Clamping lever for cutting-depth preselection
24 Cutting-depth scale
25 Wing bolt for bevel-angle preselection
26 Set of screw clamps*
27 Guide-rail adapter*
28 Guide rail*

29 Connection piece*

30 Vacuum hose*

***Accessories shown or described are not part of the standard delivery scope of the product. A complete overview of accessories can be found in our accessories program.**

Technical Data

Circular Saw		GKS 190 Professional
Article number		3 601 F23 0..
Rated power input	W	1400
No-load speed	min^{-1}	5500
Cutting depth, max. – for 0° bevel angle – for 45° bevel angle	 mm mm	 70 50
Spindle lock		●
Base plate dimensions	mm	302 x 140
Saw blade diameter, max.	mm	190
Saw blade diameter, min.	mm	184
Blade thickness, max.	mm	2.0
Mounting bore	mm	30
Weight according to EPTA-Procedure 01/2003	kg	4.2
Protection class		⧈ / II

The values given are valid for nominal voltages [U] of 230/240 V. For lower voltage and models for specific countries, these values can vary.

Please observe the article number on the type plate of your machine. The trade names of the individual machines may vary.

Noise/Vibration Information

Measured values determined according to EN 60745.

Typically the A-weighted noise levels of the product are: Sound pressure level 96 dB(A); Sound power level 107 dB(A). Uncertainty K = 3 dB.

Wear hearing protection!

Vibration total values (triax vector sum) determined according to EN 60745:
Vibration emission value a_h < 2.5 m/s^2, Uncertainty K = 1.5 m/s^2.

The vibration emission level given in this information sheet has been measured in accordance with a standardised test given in EN 60745 and may be used to compare one tool with another. It may be used for a preliminary assessment of exposure.
The declared vibration emission level represents the main applications of the tool. However if the tool is used for different applications, with different accessories or poorly maintained, the vibration emission may differ. This may significantly increase the exposure level over the total working period.
An estimation of the level of exposure to vibration should also take into account the times when the tool is switched off or when it is running but not actually doing the job. This may significantly reduce the exposure level over the total working period.
Identify additional safety measures to protect the operator from the effects of vibration such as: maintain the tool and the accessories, keep the hands warm, organisation of work patterns.

Declaration of Conformity CE

We declare under our sole responsibility that the product described under “Technical Data” is in conformity with the following standards or standardization documents: EN 60745 according to the provisions of the directives 2004/108/EC, 98/37/EC (until 28 Dec 2009), 2006/42/EC (from 29 Dec 2009).

Assembly

Mounting/Replacing the Saw Blade

- ▶ **Before any work on the machine itself, pull the mains plug.**
- ▶ **When mounting the saw blade, wear protective gloves.** Danger of injury when touching the saw blade.
- ▶ **Only use saw blades that correspond with the characteristic data given in the operating instructions.**
- ▶ **Do not under any circumstances use grinding discs as the cutting tool.**

Selecting a Saw Blade

An overview of recommended saw blades can be found at the end of this manual.

Removal of the Saw Blade (see figure A)

For changing the cutting tool, it is best to place the machine on the face side of the motor housing.

- – Press the spindle lock button **4** and keep it pressed.
- ▶ **The spindle lock button 4 may be actuated only when the saw spindle is at a standstill.** Otherwise, the power tool can be damaged.
- – With the Allen key **16**, unscrew the clamping bolt **17** turning in rotation direction ❶.
- – Tilt back the retracting blade guard **11** and hold firmly.
- – Remove the clamping flange **18** and the saw blade **19** from the saw spindle **21**.

Mounting the Saw Blade (see figure A)

For changing the cutting tool, it is best to place the machine on the face side of the motor housing.

- – Clean the saw blade **19** and all clamping parts to be assembled.
- – Tilt back the retracting blade guard **11** and hold firmly.
- – Place the saw blade **19** on to the mounting flange **20**. The cutting direction of the teeth (direction or arrow on saw blade) and the direction-of-rotation arrow on the blade guard **15** must correspond.
- – Mount the clamping flange **18** and screw in the clamping bolt **17** turning in rotation direction ❷. Observe correct mounting position of mounting flange **20** and clamping flange **18**.
- – Press the spindle lock button **4** and keep it pressed.
- – With the Allen key **16**, tighten the clamping bolt **17** turning in rotation direction ❷. The tightening torque is between 6–9 Nm, which corresponds to hand tight plus ¼ turn.

Dust/Chip Extraction

- ▶ **Before any work on the machine itself, pull the mains plug.**
- ▶ Dusts from materials such as lead-containing coatings, some wood types, minerals and metal can be harmful to one's health. Touching or breathing-in the dusts can cause allergic reactions and/or lead to respiratory infections of the user or bystanders.
  Certain dusts, such as oak or beech dust, are considered as carcinogenic, especially in connection with wood-treatment additives (chromate, wood preservative). Materials containing asbestos may only be worked by specialists.
  - – Use dust extraction whenever possible.
  - – Provide for good ventilation of the working place.
  - – It is recommended to wear a P2 filter-class respirator.

  Observe the relevant regulations in your country for the materials to be worked.

Mounting the Extraction Adapter (see figure B)

Attach the extraction adapter **22** onto the sawdust ejector **14** until it latches. A vacuum hose with a diameter of 35 mm can be connected to the extraction adapter **22**.

- **The extraction adapter may not be mounted when no external dust extraction is connected.** Otherwise the extraction channel can become clogged.
- **Do not connect a dust bag to the extraction adapter.** Otherwise the extraction system can become clogged.

To ensure optimum extraction, the extraction adapter **22** must be cleaned regularly.

External Dust Extraction

Connect the vacuum hose **30** to a vacuum cleaner (accessory). An overview for connecting to various vacuum cleaners can be found at the end of this manual.

The machine can be plugged directly into the receptacle of a Bosch all-purpose vacuum cleaner with remote starting control. The vacuum cleaner starts automatically when the machine is switched on.

The vacuum cleaner must be suitable for the material being worked.

When vacuuming dry dust that is especially detrimental to health or carcinogenic, use a special vacuum cleaner.

Operation

Operating Modes

- **Before any work on the machine itself, pull the mains plug.**

Adjusting the Cutting Depth (see figure C)

- **Adjust the cutting depth to the thickness of the workpiece.** Less than a full tooth of the blade teeth should be visible below the workpiece.

Loosen the clamping lever **23**. For a smaller cutting depth, pull the saw away from the base plate **12**; for a larger cutting depth, push the saw toward the base plate **12**. Adjust the desired cutting depth at the cutting-depth scale. Tighten the clamping lever **23** again.

If the cutting depth cannot be fully adjusted after loosening clamping lever **23**, pull clamping lever **23** away from the saw and swivel it downward. Release the clamping lever **23** again. Repeat this procedure until the requested cutting depth can be adjusted.

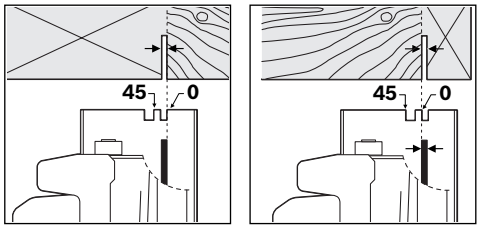
If the cutting depth cannot be sufficiently locked after tightening clamping lever **23**, pull clamping lever **23** away from the saw and swivel it upward. Release the clamping lever **23** again. Repeat this procedure until the cutting depth is locked.

Adjusting the Cutting Angle

Loosen the wing bolts **6** and **25**. Tilt the saw sidewards. Adjust the desired measure on the scale **5**. Tighten the wing bolts **6** and **25** again.

Note: For bevel cuts, the cutting depth is smaller than the setting indicated on the cutting-depth scale **24**.

Cutting Marks



The 0° cutting mark (**9**) indicates the position of the saw blade for right-angled cuts. The 45° cutting mark (**8**) indicates the position of the saw blade for 45° cuts.

For precise cuts, position the circular saw against the workpiece as shown in the figure. It is best to carry out a trial cut.

Starting Operation

▶ **Observe correct mains voltage! The voltage of the power source must agree with the voltage specified on the nameplate of the machine. Power tools marked with 230 V can also be operated with 220 V.**

Switching On and Off

To **start** the machine, **first** push the lock-off button for the On/Off switch **2** and **then** press the On/Off switch **1** and keep it pressed.

To switch off the machine, **release** the On/Off switch **1**.

Note: For safety reasons, the On/Off switch **1** cannot be locked; it must remain pressed during the entire operation.

Working Advice

Protect saw blades against impact and shock.

Guide the machine evenly and with light feed in the cutting direction. Excessive feed significantly reduces the service life of the saw blade and can cause damage to the power tool.

Sawing performance and cutting quality depend essentially on the condition and the tooth form of the saw blade. Therefore, use only sharp saw blades that are suited for the material to be worked.

Sawing Wood

The correct selection of the saw blade depends on the type and quality of the wood and whether lengthway or crossway cuts are required.

When cutting spruce lengthways, long spiral chips are formed.

Beech and oak dusts are especially detrimental to health. Therefore, work only with dust extraction.

Sawing with Parallel Guide (see figure D)

The parallel guide **10** enables exact cuts along a workpiece edge and cutting strips of the same dimension.

Loosen wing bolt **7** and slide the scale of the parallel guide **10** through the guide in the base plate **12**. Adjust the desired cutting width as the scale setting at the respective cutting mark **9** or **8**; see Section “Cutting Marks”. Tighten wing bolt **7** again.

Sawing with Auxiliary Guide (see figure E)

For sawing large workpieces or straight edges, a board or strip can clamped to the workpiece as an auxiliary guide; the base plate of the circular saw can be guided alongside the auxiliary guide.

Sawing with Guide Rail (see figure F–G)

The guide rail **28** is used to carry out straight cuts.

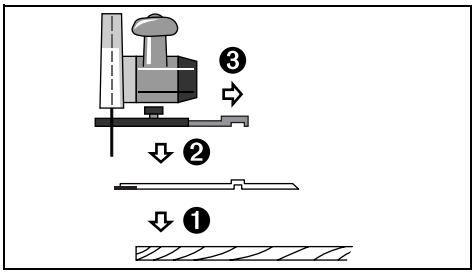
The adhesive coating prevents the guide rail from slipping and protects the surface of the workpiece. The coating of the guide rail allows the circular saw to glide easily.

The rubber lip on the guide rail acts as a splinter guard that prevents fraying or tearing out of the surface when sawing wooden materials. For this, the teeth of the saw blade must face directly against the rubber lip.

The guide-rail adapter **27** is required for working with the guide rail **28**. The guide-rail adapter **27** is mounted in the same manner as the parallel guide **10**.

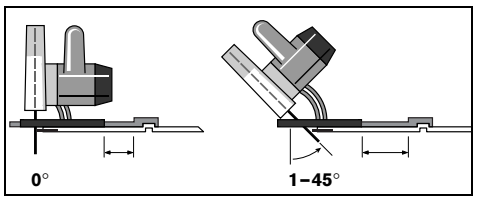
The following work steps are required for exact cuts using the guide rail **28**:

– Place the guide rail **28** on to the workpiece projecting lightly over the side. Pay attention that the side with the rubber lip faces to the workpiece.



– Set the circular saw with the premounted guide-rail adapter **27** on to the guide rail **28**.

– Adjust the desired cutting depth and the bevel angle. Observe the marks on the guide-rail adapter **27** for preadjustment of the various bevel angles; see figure F.
– Align the circular saw with guide-rail adapter in such a manner that the teeth of the saw blade **19** face against the rubber lip. The position of the saw blade **19** depends on the selected cutting angle. Do not saw into the guide rail.



– Tighten wing bolt **7** to lock the position of the guide-rail adapter.
– Remove the circular saw with the premounted guide-rail adapter **27** from the guide rail **28**.
– Align the guide rail **28** on the workpiece in such a manner that the rubber lip lies exactly alongside the cutting edge.
– **The guide rail 28 must not extend beyond the face side of the workpiece where the cut is to be started.**
– Fasten the guide rail **28** with suitable clamping devices, e. g., screw clamps, on the workpiece. Set the circular saw with the premounted guide-rail adapter **27** on to the guide rail.
– Switch the machine on and guide it in the cutting direction applying moderate and steady feed.

Two guide rails can be connected to one with use of the connection piece **29**. Clamping is carried out with the four screws located in the connection piece.

Maintenance and Service

Maintenance and Cleaning

▶ **Before any work on the machine itself, pull the mains plug.**

▶ **For safe and proper working, always keep the machine and ventilation slots clean.**

The retracting blade guard must always be able to move freely and retract automatically. Therefore, always keep the area around the retracting blade guard clean. Remove dust and chips by blowing out with compressed air or with a brush.

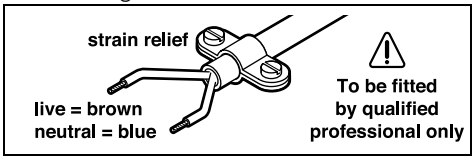
Saw blades that are not coated can be protected against corrosion with a thin coat of acid-free oil. Before use, the oil must be removed again, otherwise the wood will become soiled.

Resin and glue residue on the saw blade produces poor cuts. Therefore, clean the saw blade immediately after use.

If the machine should fail despite the care taken in manufacturing and testing procedures, repair should be carried out by an after-sales service centre for Bosch power tools.

In all correspondence and spare parts order, please always include the 10-digit article number given on the type plate of the machine.

WARNING! Important instructions for connecting a new 3-pin plug to the 2-wire cable.
The wires in the cable are coloured according to the following code:



Do **not** connect the blue or brown wire to the earth terminal of the plug.
Important: If for any reason the moulded plug is removed from the cable of this power tool, it must be disposed of safely.

After-sales Service and Customer Assistance

Our after-sales service responds to your questions concerning maintenance and repair of your product as well as spare parts. Exploded views and information on spare parts can also be found under:
www.bosch-pt.com
Our customer consultants answer your questions concerning best buy, application and adjustment of products and accessories.

Disposal

The machine, accessories and packaging should be sorted for environmental-friendly recycling.

Only for EC countries:

Do not dispose of power tools into household waste!
According the European Guideline 2002/96/EC for Waste Electrical and Electronic Equipment and its implementation into national right, power tools that are no longer usable must be collected separately and disposed of in an environmentally correct manner.

Subject to change without notice.
